Compiler Process

- ➤ Compiler Stage: All C++ language code in the .cpp file is converted into a lower-level language called Assembly language; making .s files.
- Assembler Stage: The assembly language code made by the previous stage is then converted into object code which are fragments of code which the computer understands directly. An object code file ends with .o.
- Linker Stage: The final stage in compiling a program involves linking the object code to code libraries which contain certain "built-in" functions, such as cout. This stage produces an executable program, which is named a.out by default.

Makefiles

- > Provide a way for separate compilation.
- Describe the <u>dependencies</u> among the project files.
- ➤ The <u>make</u> utility.

Using makefiles

Naming:

- makefile or Makefile are standard
- > other name can be also used

Running make

make

make -f *filename* - if the name of your file is not "makefile" or "Makefile"

Sample makefile

Makefiles main element is called a *rule*:

```
target : dependencies

TAB commands #shell commands
```

Example:

```
my_prog : eval.o main.o
   g++ -o my_prog eval.o main.o

eval.o : eval.c eval.h
   g++ -c eval.c
main.o : main.c eval.h
   g++ -c main.c

# -o to specify executable file name
# -c to compile only (no linking)
```

Variables

The old way (no variables)	A new way (using variables)
	C = g++ OBJS = eval.o main.o HDRS = eval.h
<pre>my_prog : eval.o main.o g++ -o my_prog eval.o main.o eval.o : eval.c eval.h g++ -c -g eval.c main.o : main.c eval.h g++ -c -g main.c</pre>	<pre>my_prog : eval.o main.o \$(C) -o my_prog \$(OBJS) eval.o : eval.c \$(C) -c -g eval.c main.o : main.c \$(C) -c -g main.c \$(OBJS) : \$(HDRS)</pre>

Automatic variables

Automatic variables are used to refer to specific part of rule components.

```
target : dependencies

TAB commands #shell commands
```

```
eval.o : eval.c eval.h g++ -c eval.c
```

- \$@ The name of the target of the rule (eval.o).
- \$< The name of the first dependency (eval.c).</pre>
- \$^ The names of all the dependencies (eval.c eval.h).
- \$? The names of all dependencies that are newer than the target

make options

make options:

link them!!

filename - when the makefile name is not standard
t - (touch) mark the targets as up to date
q - (question) are the targets up to date, exits with 0 if true
n - print the commands to execute but do not execute them
t - q, and -n, cannot be used together/
s - silent mode
k - keep going - compile all the prerequisites even if not able to

Conditionals (directives)

Possible conditionals are:

```
if ifeq ifneq ifdef ifndef
```

All of them should be closed with endif.

Complex conditionals may use elif and else.

Example:

```
libs_for_gcc = -lgnu
normal_libs =
ifeq ($(CC),gcc)
    libs=$(libs_for_gcc) #no tabs at the beginning
else
    libs=$(normal_libs) #no tabs at the beginning
```
